Light Reflectancy Values

This information is provided for your use in determining the contrast between two colors that normally constitute the graphic image and the background of a sign. The light reflectancy values (LRV) shown here have been measured using Tristimulus Y value under D65 illuminant. Note there are different values for surface and sub-surface applied color.

To determine contrast, subtract the darker value from the brighter, divide by the brighter, and multiply by 100.
 Note: Brighter values have higher numbers.

The formula is $\{B1 - B2\} \div \{B1\} \times 100 = \text{Contrast}$.
 For Example, white letters on a black background (all first surface):
 $\{86.64 - 4.16\} \div 86.64 \times 100 = 95.20$

The ADA Accessibility Guidelines recommend at least 70 percent contrast between characters and their backgrounds.
